

ABSTRACT OF THE DISCLOSURE

The present invention relates to a laminated business form intermediate that is used in the carriage or portage of a business form through processing equipment such that the business form intermediate can be read or scanned and the transaction completed. The intermediate includes a pressure sensitive laminated assembly that uses a pressure sensitive adhesive and release surface so as to be able to expose at least a portion of the adhesive to enable the business form to be connected to the laminate for processing. The business form intermediate of the present invention can accommodate one or more business form documents as well as documents of varying sizes and configurations.
